## BONDING A POLYMER MEMBER TO A METALLIC MEMBER

### BACKGROUND OF THE INVENTION

This invention generally relates to attachment of high strength polymeric  
5 members to a metallic member and particularly to the attachment of polymeric tubes  
to metallic tubes in intravascular devices such as catheters for use in percutaneous  
transluminal coronary angioplasty (PCTA).

In a typical PTCA procedure a dilatation balloon catheter is advanced over a  
guidewire to a desired location within the patient's coronary anatomy where the  
10 balloon of the dilatation catheter is properly positioned within the stenosis to be  
dilated. The balloon is then inflated to a predetermined size with radiopaque liquid  
at relatively high pressures (generally 4-20 atmospheres) to dilate the stenosed  
region of the diseased artery. One or more inflations may be needed to effectively  
dilate the stenosis. The catheter may then be withdrawn from the stenosis or  
15 advanced further into the patient's coronary anatomy to dilate additional stenoses.  
The inflation pressures used in PTCA procedures have increased considerably due  
to the utilization of high strength balloon materials. However, such higher pressures  
also place substantial stress on other catheter components and particularly the  
junctions between various catheter components. Examples of such components  
20 and junctions are the adapter and the junction with the proximal end of a metallic  
hypotube and the adapter and the distal end of a metallic hypotube and the  
polymeric tubular products which form the distal portion of a rapid exchange type  
dilatation catheter. Present manufacturing procedures involve the use of adhesives,  
heat shrinking and the like which limit the materials which can be used and the  
25 combination of materials which can be used and which complicate the  
manufacturing procedure. What has been needed and has heretofore been  
heretofore been unavailable is an uncomplicated procedure which produces high  
strength, hermetically sealed bonds.

## SUMMARY OF THE INVENTION

The present invention is directed to a system for securely bonding a high strength polymer material to a metallic member and particularly a small diameter tubular polymeric product to a small diameter tubular metallic product.

5 In accordance with the invention the polymeric member is disposed in contact with the metallic member, the polymer member is hot pressed against the metallic member at a temperature above the glass transition temperature of the polymeric material but less than the melting point thereof to effect significant plastic deformation of the polymeric material. The result is a high strength bond and a fluid  
10 tight seal which will no leak even under high pressures.

One presently preferred embodiment of the invention is directed to the bonding of small diameter tubular polymeric members to small diameter tubular metallic members. A portion of the metallic member is inserted into the inner lumen of a polymeric tubular member and a heat shrinkable collar is disposed about the  
15 portion of the polymeric tubular member into which the metallic member is disposed. Heat is applied to the heat shrinkable collar, and the polymeric tubular member, causing the collar to shrink and apply sufficient pressure against the polymeric tubular member to plastically deform it and thereby bond the polymeric material to the surface of the metallic member. The heat shrinkable collar may be left in place  
20 or removed from the polymeric tubular member after the bond is formed. A masking layer may be provided between the collar and the polymeric tubular member to prevent bonding and facilitate removal of the collar.

Generally, the polymeric material should be a high strength thermoplastic polymer which is at most semi-crystalline, preferably non-crystalline, and which is  
25 not ethylenically cross-linked. The preferred polymeric material is an engineering polymer such as polyetheretherketone (PEEK), e.g. 581G sold by Victrex. Other polymeric materials include polyetheramide sold under the trademark ULTEM by General Electric, polyphenylene sulfide and polysulfone. The metallic member may be stainless steel, such as 304 stainless steel, or a superelastic or pseudoelastic  
30 NiTi alloy. Other metallic materials may be used such as titanium and alloys thereof. There is no special surface preparation needed for the metallic members other than removing surface contaminants such as oil, grease and the like.

One of the advantages of the invention is that the bond is strong enough and the seal is sound enough so the number of parts needed to construct an intravascular catheter is reduced considerably. For example, in present conventional manufacturing practices for rapid exchange type catheters, such as the

5 LIFESTREAM Dilatation Catheter sold by Advanced Cardiovascular Systems, Inc., up to five parts are needed to attach a proximal hub or adapter to the proximal end of a hypotube shaft. With the present invention the distal end of the adapter can be bonded directly to the proximal extremity of a hypotube.

In addition to a significant reduction in the number of parts, there is no

10 adhesive used, so there is [sic] no requirements for an adhesive curing step to form an adhesive bond. The bond of the present invention between the polymeric material and metallic material is strong, durable and provides a fluid tight seal between the joined parts. These and other advantages of the invention will become more apparent from the following detailed description and the accompanying

15 exemplary drawings.

#### BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is an elevational view, partially in section, of a rapid exchange type dilatation catheter embodying features of the invention.

20 Fig. 2 is a transverse cross-sectional view of the catheter shown in Fig. 1 taken along the lines 2-2.

Fig. 3 is a transverse cross-sectional view of the catheter shown in Fig. 1 taken along the lines 3-3

Fig. 4 is a transverse cross-sectional view of the catheter shown in Fig. 1

25 taken along the lines 4-4.

Fig. 5 is an enlarged partial elevational view of a polymeric tubular member in position to be hot pressed against the metallic tubular member to facilitate the bonding therebetween.

Fig. 6 is a longitudinal cross-sectional view of the members shown in Fig. 5

30 after the bonding procedure.

### DETAILED DESCRIPTION OF THE INVENTION

Figs. 1-5 illustrate a rapid exchange type balloon dilatation catheter 10 which has an elongated shaft 11 with a dilatation balloon 12 on a distal shaft section 13 of the shaft and an adapter 14 on the proximal end of the proximal shaft section 15.

5 The proximal shaft 15 is formed of a metallic hypotube 16 with a lubricious coating 17. The distal shaft section 13 includes a distally extending tubular member 18 which has a guidewire receiving inner lumen 20 and which extends through the interior of the balloon 12 to the port 21 in the distal end of the catheter. A guidewire 22 is shown disposed within the lumen 20 and extending out the distal port 21 and  
10 the proximal port 23. The inflation lumen 24 is in fluid communication with the interior of dilatation balloon 12 through inflation port 25

The distal extremity 26 of the adapter 14 is hot pressed bonded to the proximal extremity of the proximal shaft section 15 in accordance with the invention. A high strength polymeric tubular extension 27 is hot press bonded to the distal extremity of  
15 the proximal shaft section 15 in the same manner as the distal extremity of the adapter is bonded to the proximal extremity of the proximal shaft section. In both cases the coating 17 is removed from the exterior of the hypotube 16 to facilitate direct bonding to the metallic surface.

Figs. 5 and 6 illustrate a presently preferred method of bonding the polymeric  
20 member, tubular extension 27 to the metallic tubular member 16. As shown in Fig. 5, the distal end of the metallic tubular member 16 is inserted into the inner lumen 28 of the tubular extension 27. A heat shrinkable tubular collar 29 is disposed about the proximal extremity of the tubular extension 27 and heated to heat shrink temperatures to press the proximal extremity against the exposed surface of the  
25 tubular member 16. With the high temperatures and the pressures applied, the proximal extremity is plastically deformed and is securely bonded to the metallic surface. The distal extremity of the adapter 14 is bonded to the proximal extremity of the proximal shaft section in essentially the same manner.

### 30 EXAMPLE

A stainless steel hypotube with an outer diameter of 0.024 inch (0.6 mm) and inner diameter of 0.016 inch (0.4 mm) was inserted into the inner lumen of a

polymeric tubular member form of polyetheretherketone (PEEK). The inner lumen of the polymeric tubular member was about 0.026 inch (0.7 mm) and the outer diameter was about 0.035 inch (0.9 mm). A short piece of a heat shrinkable tubular FEP with an outer diameter of about 0.077 inch (2 mm) and an inner diameter of about 0.055 inch (1.4 mm) was disposed about the exterior of the polymeric tubular member. The assembly was subjected to an air stream at 450° F.(232° C.) until the tubing becomes cloudy. Upon cooling, the FEP tubular collar was removed. The bond between the PEEK member and the stainless steel member was sound and leak free at internal pressures of up to 650 psi.

10        Although individual features of embodiments of the invention may be shown in some of the drawings and not in others, those skilled in the art will recognize that individual features of one embodiment of the invention can be combined with any or all the features of one or more of the other embodiments.

**WHAT IS CLAIMED IS:**

1. A method of securing a polymeric member to a metallic member in a high strength fluid tight relationship comprising:

a) mounting the polymeric member against the metallic member;

and

b) hot pressing the polymeric member against the metallic member at a temperature above the glass transition temperature and below the melting point of the polymeric material of the polymeric member while subjecting the polymeric material to plastic deformation.

2. The method of claim 1 wherein the polymeric member is a tubular element with an inner lumen extending therethrough and at least part of the metallic member is disposed within the inner lumen of the polymeric member and the polymeric material surrounding the metallic member is hot pressed against the portion of the metallic member within the inner lumen.

3. The method of claim 1 wherein the polymeric material from which the polymeric member is formed is a thermoplastic polymer selected from the group consisting of polyetheretherketone, polyetheramide, polyphenylene sulfide and polysulfone.

4. The method of claim 1 wherein the hot pressing of the polymeric member against the metallic member includes placing a heat shrinkable member about the polymeric member and the metallic member, heating the heat shrinkable member to shrink said member against the polymeric and metallic members, causing the temperatures of both the polymeric and metallic members to increase to a temperature above the glass transition temperature of the polymeric material and apply adequate pressure to cause the polymeric member to be plastically deform and bond to the metallic member.

5. The method of claim 4 wherein the heat shrinkable member is removed from the junction between the polymeric material and the metallic member.

6. The method of claim 4 wherein the heat shrinkable member is a polymeric collar.

5 7. The method of claim 4 wherein the polymeric collar is formed of a fluoropolymer.

8. An intravascular catheter with an elongated shaft comprising:  
a) an elongated metallic tubular member having proximal and  
10 distal ends and an inner lumen extending between the proximal and distal ends;  
b) a polymeric tubular member having proximal and distal ends and an inner lumen extending between the proximal and distal ends; and  
c) a hot pressed bond between one part of the metallic tubular  
15 member and one part of the polymeric tubular member.

9. The intravascular catheter of claim 8 wherein the polymeric material is a thermoplastic polymer selected from the group consisting of polyetheretherketone, polyetheramide, polyphenylene sulfide and polysulfone.  
20

10. The intravascular catheter of claim 8 wherein the one end of the polymeric tubular member is disposed about and hot press bonded to the exterior of one end of the metallic tubular member.

25 11. A balloon dilatation catheter comprising:  
a) an elongated proximal shaft section formed at least in part of a metallic tubular member having proximal and distal ends and an inner lumen extending between the proximal and distal ends;  
b) an elongated distal shaft section formed at least in part of a  
30 polymeric tubular member having proximal and distal ends and an inner lumen extending between the proximal and distal ends;

c) a hot pressed bond between part of the metallic tubular member and part of the polymeric tubular member; and

d) an inflatable dilatation balloon on the distal shaft section having an interior in fluid communication with the inner lumen of the polymeric tubular member.

5

12. An intravascular catheter with an elongated shaft comprising:

a) an elongated metallic tubular member having proximal and distal ends and an inner lumen extending between the proximal and distal ends;

10

b) a polymeric adapter having proximal and distal ends and an inner lumen extending between the proximal and distal ends; and

c) a hot pressed bond between the proximal end of the metallic tubular member and the distal end of the polymeric adapter.

15

13. The intravascular catheter of claim 12 wherein the distal end of the polymeric adapter is bonded to the exterior of the proximal end of the metallic tubular member.

20

14. The intravascular catheter of claim 13 wherein the inner lumen of the metallic tubular member is in fluid communication with the inner lumen of the adapter.

25

15. A rapid exchange type balloon dilatation catheter comprising:

a) an elongated proximal shaft section formed at least in part of a metallic tubular member having proximal and distal ends and a first inner lumen extending therein;

b) an elongated distal shaft section, which is formed at least in part of a polymeric tubular member, having proximal and distal ends, a first port in the distal end and a second port spaced proximal to the distal end, a dilatation balloon with an interior, a second inner lumen extending therein which is in fluid communication with the first inner lumen in the metallic

30

tubular member and the interior of the dilatation balloon and a third inner lumen which is in fluid communication with the first and second ports; and

c) a hot pressed bond between part of the metallic tubular member and part of the polymeric tubular member.
